## **When is a paternity test conducted ?**

A DNA-paternity test is carried out when there is doubt as to who the father of someone is, and when it should be determined by scientific means. Typical situations in which a paternity test might be carried out:

- to clarify the paternity of a child, when there is personal doubt
- on acknowledgement of paternity
- in disputes over paternity, out of court or in court
- to determine relationships of relatives through sibling tests and family tree analysis
- in estate issues, where the lineage is uncertain

The uncomplicated determination of paternity is a fast way to come to an agreement in custody questions. This avoids expensive custody battles in court.

In case of questions do not hesitate to contact us at bj-diagnostik GmbH, telephone +49 641 2099102 or by email: [info@bj-diagnostik.de](mailto:info@bj-diagnostik.de)
